

Ornamental Flowers

(G. J. Nelson PhD, Loma Linda, CA). Associate professor of Chemistry at Loma Linda University states in personal experience with concentration of elements found in *Panak-ite* composite, are not known to be harmful, and the addition of this material to soil improved the growth and appearance of **shrubby** around his home, particularly with reference to his **hibiscus**.

(R. W. Stimming, Oxnard, CA), Commercial flower grower attests to enhanced properties of **daisies** and **Statice sinuata** using 500 pounds of *Panak-ite* per acre. Says that the plants are above average conformity with good, strong stems. The color of the

leaves and **flowers** is brighter and better than he has seen in years.

(Rudolph C., Panaca, NV) Living in Panaca I wondered if the soil near our mobile home had enough residual minerals in it, being only a couple miles from the quarry, to get the same results. I planted one row of sunflowers, beans and roses using the usual fertilizers and another adding a few ounces of *Panak-ite* at intervals and you wouldn't believe the difference! The sunflowers treated with *Panak-ite* were eight feet tall and the disk flowers alone measure a foot across. The corn and beans in the *Panak-ite* rows were also much taller with bigger, and with

more plentiful blossoms than the control rows.

(Betsy H., Bend OR) My indoor Gardenia had not bloomed in three years, nor shown anything but occasional leaf growth. I thought it might even be slowly dying. In fact it was starved for minerals. Within 20 days of adding just a two teaspoonfuls of *Panak-ite* five new buds burst out along with many beautiful new leaves.

(Sharon L, Santa Barbara, CA)

After hearing about the success with *Panak-ite* others were having I tried it on my orchids and they are doing better than ever. However, it seems my dog Rocky, also fancied the minerals, and I was lucky that any were left over for my flowers. No sooner had we finished putting some around then he disappeared. Rocky got into most of the plants where we had placed the *Panak-ite* and licked it up, generally making a mess of our greenhouse before we realized where he was, and put a stop to it!
